and take appropriate actions when necessary.

- Investigation by CFS is ongoing.
- *Cronobacter sakazakii* is a pathogen that generally causes disease only in people with weakened immune systems. The bacterium can cause invasive infections (e.g. sepsis or meningitis) in infant. Neonates ( $\leq 28$  days old) and infants less than 2 months of age, in particular those that are pre-term, low-birth-weight ( $< 2.5$  kg) and immunocompromised, are at greatest risk. Powdered infant formulae were established as the source of *C. sakazakii*.
